```
The invention relates to methods of therapy for Alzheimer's disease using peptides (AAM45343-6) that bind to the neurotrophin receptor p75 nerve growth factor receptor (NGFR) and competitively inhibit the binding of a beta-amyloid to the p75 NGFR. Also described is a new method for evaluating the risk of an individual to develop Alzheimer's disease using cultured neural crest-derived melanocytes. The methods can be used using cultured neural crest-derived melanocytes. The methods can be used neurodegenerative diseases mediated by beta-amyloid protein, or by aberrant activation of the low affinity NGFR localised on neural cell surfaces, such as autoimmune encephalomyelitis, Huntington's disease, cortico-basal degeneration, progressive supra-nuclear palsy, Gerotuan-Shausslesr Scheinker syndrome, Neimann-pick disease, and genoresive supranuclear palsy. In the diagnostic tests, the human melanocytes, which are easily obtainable from skin biopsies, are good model cells for the study and diagnosis of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cyclic peptide; p75NTR; p75 neurotrophin receptor; nerve growth factor; NGF; melanocyte; kerathnocyte; apoptosis; Bc1-2; beta-amyloid; Alzheimer's disease; pseudo-ligand; hair growth; hair colour; skin colour; alopecia areata; male pattern baldness.

```
This sequence is a cyclic peptide which competes with and competitively inhibits beta-amyloid binding to the p75 neurotrophin receptor (p75NTR). P75NTR is a low affinity nerve growth factor (NGF) receptor which is expressed by melanocytes and keratinocytes of the basal epidermis. Apoptosis can be inhibited by p75NTR via the upregulation of the Bcl-2 protein. If the receptor is occupied by appropriate ligands e.g. neurotrophins, apoptosis is inhibited. Other examples of appropriate ligands include this cyclic peptide. This peptide is based on the sequence of the binding fragment of beta-amyloid, which binds to p75NTR in Alzaheimer's disease. This cyclic peptide can be used in methods involve using this peptide or peptides AAY39234-Y39235 to bind as a pseudo-ligand to the p75 neurotrophin receptor, inhibiting apoptosis. The new method can induce or maintain hair growth, hair colour or skin colour. Inducing or maintaining hair growth is useful for treating alopecia areata or male pattern baldness in vertebrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inhibition of beta-amyloid binding to the p75 nerve growth factor receptor using polypeptides, useful in the diagnosis and treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
Controlling or manipulating melanocyte and keratinocyte cell death, useful for treating, e.g. alopecia areata
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 p75 nerve growth factor receptor; inhibitor; Alzheimer's disease; neurodegenerative disease; cyclic.

The invention relates to methods for inhibiting binding of beta-amyloid to the p75 nerve growth factor receptor. The methods comprise contacting the cell with a substance that binds to the p75 nerve growth centacting the cell with a substance that binds to the p75 nerve growth can be proved to the p75 nerve growth can be present a citivation of the low affinity of by beta-amyloid protein, or by aberrant activation of the low affinity nerve growth factor receptor localised on neural cell surfaces. Such diseases include autoimmune encephalomyelitis, Huntington's disease, pick's disease, corticobasal degeneration, progressive supranuclear palsy, Gerotman-Shausslear Scheinker syndrome, Nieman-Pick disease and Down's syndrome. The present sequence is a cyclic peptide comprising a fragment of the human beta-amyloid protein to which a cysteine residue has been added at each end. The peptide inhibits binding of beta-amyloid to the p75 nerve growth factor receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Beta-amyloid; p75; nerve growth factor receptor; NGFR; anti-apoptotic; Alzheimer's disease; neurotrophin receptor; NTR; human; cyclic.

The invention relates to a method of inhibiting beta-amyloid binding to

```
ö
                      Involves contacting the cell with a substance having the amino acid sequence lysine-glycine-lysine or lysine-glycine-alanine. The substance binds to the p75 NGFR resulting in the inhibition of beta-amyloid protein or beta-amyloid peptide binding to the p75 NGFR. The invention is useful for evaluating the risk of an individual to develop Alzheimer's disease and methods of therapy for Alzheimer's disease using peptides that bind to the neurotrophin receptor (NTR) and competitively inhibit the binding of beta-amyloid to the receptor. In vitro methods are also provided for decreasing cell apoptosis mediated by beta-amyloid. The present sequence represents a cyclic peptide that competes for p75NTR binding with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents residues 24 to 31 of beta-amyloid. A cyclic peptide was synthesised by attaching two cysteine residues to the beginning and the end of the fragment. The invention relates to a new method for evaluating the risk of an individual to develop Alzheimer's disease using cultured neural crest-derived melanocytes. Also described are methods of therapy for Alzheimer's disease using peptides (AAM45343-6) that bind to the neurotrophin receptor p5 nerve growth factor receptor (NGFR) and competitively inhibit the binding of a beta-amyloid to the p75 NGFR. The methods can be used for diagnosing and treating Alzheimer's disease and other neurodegenerative diseases mediated by beta-amyloid protein, or by aberrant activation of the low affinity NGFR localised on neural cell surfaces, such as autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Evaluating risk of individual to develop Alzheimer's - uses cultured epidermal melanocyte(s), also useful for developing therapies for neuro-degenerative diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Beta-amyloid; Alzheimer's disease; diagnosis; melanocyte; fragment; neurotrophin receptor p75; p75NTR; cyclic.
p75 nerve growth factor receptor (NGFR) of a cell. The method

This sequence is amino acids 24-31 of beta-amyloid. This sequence can be used to generate cyclic peptide AAY99233. The cyclic peptide competes with and competitively inhibits beta-amyloid binding to the p75 neurotrophin receptor (p75MTR) beta-amyloid binding to the p75 neurotrophin receptor which is expressed by melanocytes and keratinocytes of the basal epidemia. Apoptosis can be inhibited by p75MTR via the upregulation of the Bcl-2 protein. If the receptor is occupied by appropriate ligands e.g. neurotrophins, apoptosis is inhibited. Other cxamples of appropriate ligands include this cyclic peptide. This peptide is based on the sequence of the binding fragment of beta-amyloid, which binds to p75MTR in Alzheimer's disease. This cyclic peptide can be used in methods to control or manipulate keratinocyte or melanocyte cell death. The methods involve using this peptide or peptides AAY39234-Y3935 to bind as a pseudo-ligand to the p75 neurotrophin receptor, inhibiting a proportier. Inducing or maintening hair growth is useful for reating alopecia areata or mainten baldness in vertebrates.
                                                                                                                                                                                                                                                                                                                                                                                   ö
                             progressive supra-nuclear palsy, Gerotman-Shausslesr Scheinker syndrome, Neimann-Pick disease, and progressive supranuclear palsy. In the diagnostic tests, the human melanocytes, which are easily obtainable from skin biopsies, are good model cells for the study and diagnosis of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  p75NTR; p75 neurotrophin receptor; nerve growth factor; NGF; melanocyte; keratinocyte; apoptosis; Bc1-2; beta-amyloid fragment; Alzheimer's disease; pseudo-ligand; hair growth; hair colour; skin colour; alopecia areata; male pattern baldness.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to methods for inhibiting binding of beta-amyloid to the p75 nerve growth factor receptor. The methods comprise contacting the cell with a substance that binds to the p75 nerve growth factor receptor. The methods are useful in the diagnosis and treatment of Alzheimer's disease and other neurodegenerative diseases mediated by beta-amyloid protein, or by aberrant activation of the low affinity diseases include autoimmune encephalomyelitis, Huntington's disease, Pick's disease, corticobasal degeneration, progressive supranuclear palsy, Gerotman-Shausslesr Scheinker syndrome. Nieman-Pick disease and Down's syndrome. The present sequence is a fragment of the human beta-amyloid protein. It may be used to produce a cyclic decapetide that inhibits binding of beta-amyloid to the p75 nerve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibition of beta-amyloid binding to the p75 nerve growth factor receptor using polypeptides, useful in the diagnosis and treatment of e.g. Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of inhibiting beta-amyloid binding to inverve growth factor receptor (NGFR) of a cell. The method sequence lysine-glycine-lysine or lysine-glycine-lysine or lysine-glycine-lysine or lysine-glycine-alanine. The substance binds to the p75 NGFR resulting in the inhibition of beta-amyloid protein or beta-amyloid peptide binding to the p75 NGFR. The invention is useful for evaluating the risk of an individual to develop Alzheimer's disease and methods of therapy for Alzheimer's disease using peptides that bind beta-amyloid to the receptor and competitively inhibit the binding of beta-amyloid to the receptor. In vitro methods are also provided for screening substances and identifying those capable of inhibiting, or decreasing cell apoptcosis mediated by beta-amyloid. The present sequence represents a beta-amyloid fragment.
                                                                                                                                                                                                         Beta-amyloid; p75; nerve growth factor receptor; NGFR; anti-apoptotic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Evaluating risk of an individual to develop Alzheimer's disease using cultured neural crest-derived melanocytes and methods of therapy for Alzheimer's disease using peptides that bind to the neurotrophin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein carpp. Meta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta neceptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nociropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of
Amyloid deposit; APP; Abeta; brain; human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective; amyloid precursor protein; Alzheimer's disease.

                                                                                                                                                                                                                                   disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to abeta, the antibody binds to an amyloid deposit and induces a clearing response (For receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta, or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The products of prophylactic and therapeutic treatment of

activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of Alzhelmer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a recombinant hepadnavirus nucleocapsid protein, i.e. a chimeric hepatitis B core (HBC) protein (I), displaying one or more immunogenic epitopes at the N-terminus, HBC immunogenic loop (L) or C-terminus, or having a heterologous linker for a conjugated epitope in (L), and containing a Cys residue at, or near, the C-terminus that orders enhanced stability to the particles. A vaccine comprising (I) is useful for inducing an immune response in an inoculated host animal, by inoculating a host animal with the vaccine, and maintaining that
This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient. (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (Foreceptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta, or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel recombinant hepadnavirus nucleocapsid protein, termed as chimeric hepatitis B core protein, displays immunogenic epitopes at N-terminus, HBc immunogenic loop with linker for conjugated epitope and C-terminus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunogenic, hepadnavirus nucleocapsid protein; hepatitis B core; HBc; vaccine; B cell epitope; T cell epitope; Immunostimulant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

                                                            the C-terminal residue or in which a C-terminal Cys is replaced by another residue. The chimer particles are most stable on storage in aqueous compositions that are particles are most stable on storage in aqueous compositions that are particles of similar sequence that lack any C-terminal Cys residues. The chimer molecule exhibits the self-assembly not exhibiting the nucleic acid binding of those native particles, and excellent B cell and T cell immunogenicities. The chimer particles are typically prepared in higher yield than similar particles that are free of a C-terminal Cys. The particles are often far more immunogenic than the similar conjugates that lack a C-terminal Cys. Immunogenic than particles assembled from the chimer molecules are enhanced as compared to similar particles assembled from collmer molecules lacking at least one C-terminal Cys. AAU33802-AAU3397 represent immunogenic HBc particles and related sequences of the invention.
               develop an immune response. The immunogenic particles formed using (I) are substantially free of binding to nucleic acids, and are most stable than the particle formed from otherwise identical HBc chimer that lacks
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity
                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

(I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent
peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB9241 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity
                                                                                                                                                                                                                                                                                                                                           Gaps

comprising therebentically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity of the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases.
                                                                                                                                                                                                                             ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity
               Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes.

AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Protection, endogenous therapeutic peptide, peptidase, conjugation, blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    present invention describes a modified therapeutic peptide (I)
 administration due to rapid degradation by peptidases in the body
                                                                                                                                                                                                                           ;

US-09-163-095-1

Sequence 1, Application US/09163095

Sequence 1, Application US/09163095

Patent No. 642416

GENERAL INFORMATION:

APPLICANT: Gilchrest, Barbara A.

APPLICANT: Yaar, Mina

TITLE OF INVENTION: METHODS FOR DIAGNOSING AND TREATING

TITLE OF INVENTION: ALZHEIMER'S DISEASE

FILE REFERENCE: BU96-09AZ

CURRENT APPLICATION NUMBER: US/09/163,095

CURRENT PILING DATE: 1998-09-29

EARLIER APPLICATION NUMBER: PCT/US97/04966

EARLIER FILING DATE: 1997-03-28

BARLIER PILING DATE: 1997-03-28

Patent No. 5854204
GENERAL INFORMATION:
APPLICANT: Findeis, Mark A. et al.
TITLE OF INVENTION: Ab Peptides that Modulate b-Amyloid
TITLE OF INVENTION: Aggregation
NUMBER OF SEQUENCES: 40
CORRESPONDENCE ADDRESS:
ADDRESSEE: LAHIVE & COCKFIELD
STREET: 28 State Street, Suite 510
                                                                                                                                                                                                                                                                                             COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
This sequence is a cyclic peptide which competes with and competitively inhibits beta-amyloid binding to the p75 neurotrophin receptor (p75NTR). P75NTR is a low affinity nerve growth factor (NGF) receptor which is expressed by melanocytes and keratinocytes of the basal epidermis. Apoptosis can be inhibited by p75NTR via the upregulation of the Bcl-2 protein. If the receptor is occupied by appropriate ligands e.g. neurotrophins, apoptosis is inhibited. Other examples of appropriate ligands include this cyclic peptide. This peptide is based on the p75NTR in Alzheimer's disease. This cyclic peptide can be used in methods involve using this peptide or peptide can be used in methods involve using this peptide or peptides call death. The methods involve using this peptide or peptides Apy39233/x39235 to bind as a pseudo-ligand to the p75 neurotrophin receptor, inhibiting a poptosis. The new method can induce or maintain hair growth hair colour or skin colour. Inducing or maintaining hair growth is useful for treating alopecia areata or male pattern baldness in vertebrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; secreted protein; immunosuppressive; antiarthritic; antirheumatic;

Polynucleotide sequences AAC93422 - AAC93449 represent cDNA encoding human secreted proteins AAB51724 - AAB51777. Sequences AAB51786 - AAB51825 represent alternative polypeptides encoded by the genes, and amino acid sequences to which they are homologous. The genes and proteins have activities dependent on the tissues and cells in which they are expressed. Examples of their activities include immunosuppressive; antiarthritic; antirheumatic; antiproliferative; cytostatic; cardiant;
                                                                                                                                                                                                                                                                                                                           vasotropic; cerebroprotective; notropic; neuroprotective; antibacterial; variotide; pothalmalogical; and vulnerary. The secreted proteins, polynucleotides, antagonists and agonists may be useful in treating, preventing and/or diagnosing diseases and disorders such as autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebroascular disorders e.g. cardiac arrest, cerebroascular disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and coular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. Oligonucleotide AAC93413 - AAC93421 and peptide AAB51723 are

                                                                                                                                                                                                                                     Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by a canes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. A caces is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                     Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymersae chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                               diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences.                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                   capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                          (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The
                                                                                                                                                                                                                                                                                  Gaps
                                                                                           The invention relates to an isolated nucleic acid detection reagent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (1) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polyprucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity amin to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease, diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes substantially purified human proteins

(referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 to the specification). ABN15762 to ABN27252 encode the human ORFX proteins given in ABP001010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX associated disorder. In humans, and in the manufacture of a medicament for treating syndrome associated with ORFX associated disorder. ORFX polyucleotide squences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, osteoarthritis, hearforthage, osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, disorders related to organ transplantation, various immune deficiencies mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious disease, autoimmune thyroiditis, myasthenia gravis, rheumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, rheumatoid arthritis, autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, pone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from systemic cytokine damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fusion protein; receptor tyrosine kinase; Tek; Fc portion; immunoglobulin G1; IgG1; anglogenesis; tumour; ocular necvascularisation; inflammatory disease; arthritis,; rheumatism; psoriasis; eye disorder; diabetic retinopathy; necvascular glaucoma; retinoblastoma; retrolental fibroplasia; rubeosis; uveitis; macular degeneration; graft necvascularisation; cancer; metastatic sarcoma; carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                        N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

extracellular domain of the human receptor tyrosine kinase Tek and the From Fortion of human immunoglobulin (19) G1. The Tek fragment lacks all cretains the ability to bind at least one Tek ligand. The fusion polypeptide is an angiogenesis inhibitor, and a Tek antagonist. The polypeptide is an angiogenesis inhibitor, and a Tek antagonist. The polypeptide is an angiogenesis inhibitor, and a Tek antagonist. The polypeptide or solubbe Tek multimer, antibodies or antibody fragments are useful for treating a mammal having a disease or condition mediated by angiogenesis, e.g. a solid tumour a condition or disease characterized by coular neovascularisation. In particular, the Tek antagonists are useful for treating or preventing inflammatory diseases (e.g. arthritis, rheumatism or psoriasis), certain eye disorders (e.g. diabetic retinopathy of prematurity, neovascular glaucoma, retrolental fibroplasia, rubeosis, uveitis, macular degeneration or graft neovascularisation), cancer (e.g. metastatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more

genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and insectiods. Therapetics in higher eukaryotes for the development of insectiodes, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGITG-ABL30511), expressed DNA sequences (ABLIGITG-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New Tek polypeptides antagonist having a fragment of the Tek extracellular domain, useful for treating mammals with a disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     neovascularisation; cancer; metastatic sarcoma; carcinoma;
                                                                                                                                                                                                                                                                                                               ;

The present sequence represents a fusion protein comprising the extracellular domain of the human receptor tyrosine kinase Tek and the extracellular domain of the human receptor tyrosine kinase Tek and the reportion of human immunoglobulin (19) 61. The Tek fragment lacks all or part of human immunoglobulin (19) 61. The Tek fragment lacks all or part of the region containing fibronectin type III (FNIII) motifs, and retains the ability to bind at least one Tek ligand. The fusion polypeptide is an angiogenesis inhibitor, and a Tek antagonist. The polypeptide or soluble Tek multimer, antibodies or antibody fragments are useful for treating a mammal having a disease or condition mediated by angiogenesis, e.g. a solid tumour a condition or disease characterized by coular neovascularisation. In particular, the Tek antagonists are useful for treating or preventing inflammatory diseases (e.g. arthritis, rheumatism or psoriasis), certain eye disorders (e.g. diabetic retinopathy, retinopathy of prematurity, neovascular glaucoma, retinopathy of prematurity, neovascular glaucoma, retinopathy of prematularisation), cancer (e.g. metastatic egeneration or graft neovascularisation), cancer (e.g. metastatic

The present sequence represents the TEK protein, also known as TIE2 protein. TEK is a receptor tyrosine kinase. TEK contains epitopes which bind to MHC. The presentation of TEK epitopes can also stimulate the per cell and/or cytotoxic T cell responses. The immune response is directed against endothelial cells in the tumor-associated vasculature and includes production of antibodies that bind to the cells, causing coaqulation and thrombosis. The immune response is targeted to endothelial cells lining blood vessels of the tumor (these cells overexpress Tek), so damage to even a few cells will kill many tumor cells. These target cells are accessible to the immune response and problems of antigenic heterogeneity, MHC loss and resistance to apoptosis (associated with epithelial cells) are unlikely to occur in normal endothelial cells. TEK epitopes (see AAY30320-24) are used to generate antibodies, and for prevention and treatment of cancer. The peptides, and recombinant DAR constructs or viral vectors that express them, are useful as anticancer vaccines to target endothelial
                                                                                                                                                                                                                                                                                                   TEK protein; TIE2 protein; receptor tyrosine kinase; T cell response; immune response; endothelial cell; tumor-associated vasculature; coagulation; thrombosis; cancer; anticancer vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                     ó
                                                                                                                                                                              Degenerate oligonucleotide primers based on the sequence conserved in the kinase domain of all receptor tyrosine kinases was used for PCR of single stranded cDNA from human placental polyA mRNA. PCR prod. HPK-6 contained a novel sequence which was used as a probe to isolate longer fragments from a human placental cDNA library. One clone contained the entire coding region and was called the ork gene. The gene prod. shown can be used as a research tool in in vitro assays for detection of ork, its ligands or their interactions.

The invention relates to a crystalline polypeptide, comprising the catalytic domain of a receptor tyrosine kinase Tie-2 protein. The crystalline forms are useful for identifying inhibitors of a Tie-2 protein as well as determining the three dimensional structure of a the catalytic domain of a Tie-2 polypeptide. A Tie-2 inhibitor may be used to treat a Tie-2 dependent condition in a patient (especially a human), where the condition is characterized by excessive vascular proliferation e.g. a hyperproliferative disorder, cancer (e.g. sarcoma, osteona, melanoma, lupphona, and leukemia), a cardiovascular condition (myopla, chronic retinal detachment, conjunctivitis, osteona, melanoma, lupphona, chronic retinal detachment, conjunctivitis, an ocular condition (myopla, chronic retinal detachment, conjunctivitis, retinopathy, and macular degeneration), von Hippel Lindau disease, pemphigoid, psoriasis, paget's disease, polycystic kidney disease, fibrosis, sarcoidosis, cirrhosis, inflammatory bowel disease, chronic inflammation, synovitis, inflammatory bowel disease, chronic inflammation detacting and promote angiogenesis or vasculogenesis (in combination with a pro-angiogenic growth factor). The present sequence represents the human Tie-2 protein sequence.
                                                                                                                                                                                                              Tie-2; catalytic domain; receptor tyrosine kinase; crystalline; human; cytostatic; vasotropic; antianemic; antiarteriosclerotic; nephrotropic; opthalmological; hepatotropic; antithyroid; antiinflammatory; antiulcer; gastrointestinal; antirheumatic; osteopathic; antiarhritic; hemostatic; antipsoriatic; dermatological; immunosuppressive; antibacterial.

The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or diagnosing a cardiovascular, emothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, mycoardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a PRO protein of the invention.
                                                                                                                    Baker KP, Ferrara N, Gerber H, Gerritsen ME, Goddard A;

                                                                                                                                                                                                                                    methods to control or manipulate keratinocyte or melanocyte cell death. The methods involve using this peptide or peptides AAY39233-Y39234 to bind as a pseudo-ligand to the p75 neurotrophin receptor, inhibiting apoptosis. The new method can induce or maintain hair growth, hair colour or skin colour. Inducing or maintaining hair growth is useful for treating alopecia areata or male pattern baldness in vertebrates.
                                                                                                                       This sequence is a cyclic peptide which competes with and competitively inhibits beta-amyloid binding to the p75 neurotrophin receptor (p75NTR). P75NTR is a low affinity nerve growth factor (NGF) receptor which is expressed by melanocytes and keratinocytes of the basal epidermis. Apoptosis can be inhibited by p75NTR via the upregulation of the Bcl-2 protein. If the receptor is occupied by appropriate ligands e.g. neurotrophins, apoptosis is inhibited. Other examples of appropriate ligands include this cyclic peptide. This peptide is based on the sequence of the binding fragment of beta-amyloid, which binds to p75NTR in Alzheimer's disease. This cyclic peptide can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; primer; detection; diagnosis; antisense therapy; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Primer sets for synthesizing polynucleotides, particularly the 5602
                                                                Controlling or manipulating melanocyte and keratinocyte cell death, useful for treating, e.g. alopecia areata
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Yamamoto J;

The present invention describes primer sets for synthesising 5602

(111-length cDNAs defined in the specification. Where a primer set

(211-length cDNAs defined in the specification. Where a primer set

(211-length cDNAs defined in the specifide complementary

(212 comprises: (a) an oligo-dT primer and an oligonucleotide comprises one of

(213 complementary strand of a polynucleotide which comprises one of

(214 complementary strand of a polynucleotides; or (b) a combination

(215 complementary strand of a polynucleotide which comprises a 5'-end

(216 sequence and an oligonucleotide comprising a sequence complementary to the

(217 complementary strand of a polynucleotide which comprises a 3'-end sequence complementary to a

(218 polynucleotide comprises a 1 east 15 nucleotides and the combination of

(219 collique which comprises a 1 east 15 nucleotides and the combination of

(219 collidonicleotide comprises a 1 east 15 nucleotides and the combination of

(219 collidonicleotide comprises a 1 east 15 nucleotides and the combination of

(219 collidonicleotide comprises a 1 east 15 nucleotides and the combination of

(219 collidonicleotide comprises a 1 east 15 nucleotides and the combination of

(219 collidonicleotide comprises a 1 east 15 nucleotides and the combination of

(219 collidonicleotide comprises a 1 east 15 nucleotides)

(219 collidonicleotide comprises a 1 east 15 nucleotides)

(220 complementary the primers are useful for synthesising polynucleotides)

(221 collidonicleotide comprises allow obtaining of the full-length

(221 collidonicleotide comprises allow obtaining of the full-length

(221 collidonicleotide comprises allow obtaining of the full-length

(221 collidonicleotide collides)

(221 collidonicleotides)

(222 collidonicleotides)

(223 collidonicleotides)

(224 collidonicleotides)

(224 collidonicleotides)

(225 collidonicleotides)

(226 collidonicleotides)

(227 collidonicleotides)

(228 collidonicleotides)

(228 collidonicleotides)

(229 collidonicleotides)

(220 collidonicleotides)

Cancer-associated nucleic acid molecules (N) and proteins (P), where cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P carperssion. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell of treatment of colorectal carcinomas and cancers. Administration, diagnosis and treatment of colorectal carcinomas and cancers. Administration of the present invention.

N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 to 1052, 7921 and 7922.

New library of fusion nucleic acids each encoding a Rep protein recognized by a nucleic acid modification enzyme and a candidate protein, useful for detecting protein-protein interactions, protein drug discovery or pharmacogenetics

Disclosure; Fig 31; 106pp; English.

This sequence is the goose parvovirus NSI protein.

The invention relates to a library of fusion nucleic acids, each encoding a Rep protein, a candidate protein is a nucleic acid modification sequence or a label. The Rep protein is a nucleic acid modification enzyme. The random or directed libraries (including the cDNA libraries) can be introduced into any tumnour cell, and peptides identified which by themselves induce apoptosis, cell death, loss of cell division or decreased cell growth. The methods and compositions may also be used to detect protein protein interactions, protein drug discovery, particularly for protein drugs that interact with targets on cell surfaces, to discover DNA or nucleic acid binding proteins, using nucleic acids as targets, to screen for nucleic acid modification enzymes in expression vectors and in pharmacogenetic studies. The method for use in expression vectors and in pharmacogenetic studies. The methods can be combined with observations in the interval in the methods can be combined with observations and in killing tumour cells. The methods can be combined with observations and in killing tumour cells. be combined with other cancer therapeutics (drugs or radiation) to sensitize cells and thus induce rapid and specific apoptosis, cell death, loss of cell division or decreased cell growth after exposure to a secondary agent. Library of nucleic acid/protein conjugates, has a fusion of nucleic acid modification enzyme and candidate compound, and expression vector having a fusion of nucleic acids encoding NAM enzyme and the compound

Disclosure; Fig 31; 96pp; English.

protein (NAP) conjugates comprising a fusion polypeptide (with a nucleic acid modification (NAM) enzyme (E) and candidate compound), an expression vector (with a fusion of nucleic acids encoding the enzyme and candidate protein respectively), an enzyme attachment sequence (EAS; RNA sequence), where the candidate compound and candidate protein are different and EAS and the enzyme are covalently linked. The NAP conjugates are useful in screens to assay binding to target molecules and/or to screen candidate agents for the ability to modulate the activity of the target molecule. They are useful in cancer therapy. Sequences of the invention are also useful to detect protein-protein interaction, in drug discovery, to discover pan or nucleic acid binding proteins, using nucleic acids as the targets and to screen for NAM enzymes with decreased toxicity for host cells (specifically Rep proteins with reduced toxicity). NAP conjugates are also useful in pharmacogenomic studies, for screening bioactive agents on surface cells, viruses and microbial organisms. They are also useful for screening protein expression, or proteins that a so verproduction or inhibition of protein expression, or proteins that invention are also used in gene therapy. The present sequence is invention are also used in gene therapy. The present sequence is The present invention relates to genetic libraries of nucleic acid/

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence of the non-structural protein encoded by the open reading frame (ORF) 1 contained in a fragment from the Barbary duck parvovirus strain FM. The fragment contains 3 ORFs, with ORF3 being internal to ORF2, encoding a non-structural, the VP1 and VP2 proteins respectively. The virus was isolated from a 13 day old duck that had died of Barbary duck parvovirus infection, by incubating liver extracts injected into embryonated duck eggs. The DNA was isolated from the resulting 20-25 nm viral particles. The DNA sequences encoding the non-structural, vectors, host cells or attenuated parvoviruses for use as vaccines to protect Barbary ducks and geese.
                                                                                                                                                               VP1; VP2;
                                                                                                                                              Barbary duck parvovirus fragment ORF1 encodoed non-structural protein.

This sequence is the muscovy duck parvovirus NSI protein.

The invention relates to a library of fusion nucleic acids, each encoding a Rep protein, a candidate protein is a protein. a targeting acquence or a label. The Rep protein is a nucleic acid modification enzyme. The random or directed libraries (including the cDNA libraries)

Can be introduced into any tumnour cell, and peptides identified which by themselves induce apoptosis, cell death, loss of cell division or decreased cell growth. The methods and compositions may also be used to detect protein protein interactions, protein drug discovery, particularly for protein drugs that interact with targets on cell surfaces, to discover DNA or nucleic acid binding proteins, using nucleic acids as targets, to screen for nucleic acid modification enzymes uncleic acids as targets, to screen for nucleic acid modification enzymes nucleic acids as targets, to screen for nucleic acid modification enzymes unth decreased toxicity for the host cells, to identify or generate Rep proteins with decreased toxicity, improved enzyme attachment sequences for use in expression vectors and in pharmacogenetic studies. The method is useful in cancer therapy and in killing tumour cells. The methods can be combined with other cancer therapeutics (drugs or radiation) to sensitize cells and thus induce rapid and specific apoptosis, cell death, loss of cell division or decreased cell growth after exposure to a
                                                                                                                                                                    Fusion nucleic acid library; Rep protein; tumour cell; apoptosis; nucleic acid modification enzyme; cell death; decreased cell growth; protein-protein interaction detection; cell division; cancer therapy; protein drug discovery; pharmacogenetics; NSI protein; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New library of fusion nucleic acids each encoding a Rep protein recognized by a nucleic acid modification enzyme and a candidate protein, useful for detecting protein-protein interactions, protein drug discovery or pharmacogenetics

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        X X X E
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         δλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to genetic libraries of nucleic acid/
protein (NAP) conjugates comprising a fusion polypeptide (with a nucleic
acid modification (NAM) enzyme (E) and candidate compound), an expression
vector (with a fusion of nucleic acids encoding the enzyme and candidate
protein respectively), an enzyme attachment sequence (EAS; RNA sequence),
where the candidate compound and candidate protein are different and EAS
and the enzyme are covalently linked. The NAP conjugates are useful in
screens to assay binding to target molecules and/or to screen candidate
agents for the ability to modulate the activity of the target molecule.
They are useful in cancer therapy. Sequences of the invention are also
useful to detect protein-protein interaction, in drug discovery, to
seful to detect protein-protein interaction, in drug discovery, to
useful to screen for NAM enzymes with decreased toxicity for
host cells (specifically Rep proteins with reduced toxicity). NAP
conjugates and to screen for NAM enzymes with neduced toxicity in are also useful for screening proteins causing phenotypic changes such
as overproduction or inhibition of protein expression, or proteins that
also useful infectivity, etc. of the virus. Sequences of the
invention are also used in gene therapy. The present sequence is
muscoyy duck parvovirus NSI protein used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô

This sequence is the barbarie duck parvovirus Rep protein.

The invention relates to a library of fusion nucleic acids, each encoding a Rep protein, a candidate protein is a nucleic acid modification as sequence or a label. The Rep protein is a nucleic acid modification or enzyme. The random or directed libraries (including the CDNA libraries) can be introduced into any tumour cell, and peptides identified which by themselves induce apoptosis, cell dath, loss of cell division or decreased cell growth. The methods and compositions may also be used to detect protein-protein interactions, protein drug discovery, or particularly for protein drugs that interact with targets on cell particularly for protein drugs that interact with targets on cell concleic acids as targets, to screen for nucleic acid modification enzymes nucleic acids as targets, to screen for nucleic acid modification enzymes proteins with decreased toxicity for the host cells, to identify or generate Rep proteins with decreased toxicity, improved enzyme attachment sequences for use in expression vectors and in pharmacogenetic studies. The method is useful in cancer therapy and in killing tumour cells. The methods can be combined with other cancer therapeutics (drugs or radiation) to sensitize cells and thus induce repaid and specific apoptosis, cell death, considered to a considered cell growth after exposure to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                        Fusion nucleic acid library; Rep protein; tumour cell; apoptosis; nucleic acid modification enzyme; cell death; decreased cell growth; protein protein interaction detection; cell division; cancer therapy; pharmacogenetics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New library of fusion nucleic acids each encoding a Rep protein recognized by a nucleic acid modification enzyme and a candidate protein, useful for detecting protein-protein interactions, protein drug discovery or pharmacogenetics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Barbarie duck parvovirus Rep protein.

```
This sequence is the goose parvovirus Rep protein.

The invention relates to a library of fusion nucleic acids, each encoding the invention relates to a library of fusion nucleic acids. each encoding the protein, a candidate protein, a presentation structure, a targeting sequence or a label. The Rep protein is a nucleic acid modification in the random or directed libraries (including the CDNA libraries) and publication introduced into any tumour cell, and peptides identified which by themselves induce apoptosis, cell death, loss of cell division or decreased cell growth. The methods and compositions may also be used to detect protein protein interactions, protein drug discovery, particularly for protein drugs that interact with targets on cell surfaces, to discover DNA or nucleic acid binding proteins, using surfaces, to discover DNA or nucleic acid binding proteins, using vith decreased toxicity for the host cells, to identify or generate Rep proteins with decreased toxicity, improved enzyme attachment sequences for use in expression vectors and in pharmacogenetic studies. The method is useful in cancer therapy and in killing tumour cells. The methods can be combined with other cancer therappus conditions or radiation) to sensitize cells and thus induce rapid and specific apoptosis, cell death, senondary and in virial provent after exposure to a sensitize cells and thus induce rapid and specific apoptosis, cell death, senondary and an expression or decreased cell growth after exposure to a
                                                                 Fusion nucleic acid library; Rep protein; tumour cell; apoptosis; nucleic acid modification enzyme; cell death; decreased cell growth; protein protein interaction detection; cell division; cancer therapy; protein drug discovery; pharmacogenetics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

protein (NAP) conjugates comprising a fusion polypeptide (with a nucleic acid modification (NAM) enzyme (E) and candidate compound), an expression vector (with a fusion of nucleic acids encoding the enzyme and candidate protein respectively), an enzyme attachment sequence (EAS; RNA sequence), where the candidate compound and candidate protein are different and EAS and the enzyme are covalently linked. The NAP conjugates are useful in screens to assay binding to target molecules and/or to screen candidate agents for the ability to modulate the activity of the target molecule. They are useful in cancer therapy. Sequences of the invention are also useful to detect protein-protein interaction, in drug discovery, to discover DNA or nucleic acid binding proteins, using nucleic acids as the targets and to screen for NAM enzymes with decreased toxicity for host cells (specifically Rep proteins with reduced toxicity for conjugates are also useful in pharmacogenomic studies, for screening bloactive agents on surface cells, viruses and microbial organisms. They are lasto useful for screening proteins causing phenotypic changes such as overproduction or inhibition of protein capterins causing phenotypic changes such as overproduction are also used in gene therapy. The present sequence is invention are also used in gene therapy. The present sequence is

OM protein - protein search, using sw model

November 9, 2002, 13:57:44; Search time 7.69231 Seconds (without alignments) 53.919 Million cell updates/sec Run on:

US-09-632-748-4 57 1 CVGSNKGAIC 10 Title: Perfect score: Sequence:

BLOSUM62 Gapop 10.0 , Gapext 0.5 Scoring table:

112892 seqs, 41476328 residues Searched:

112892 Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 20000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt_40:* Database : Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Alzheimer's disease amyloid A4 protein homolog [Contains: Beta-amyloid protein (Beta-APP) (A-beta)] (Fragment).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             INTRACELLULAR SIGNALING PATHWAY THROUGH THE GTP-BINDING PROTEIN
                                            Brain Res. Mol. Brain Res. 10:299-305(1991).
-!- FUNCTION: FUNCTIONAL NEURONAL RECEPTOR WHICH COUPLES TO INTRACELLULAR SIGNALING PATHWAY THROUGH THE GTP-BINDING PROTEIN G(O) (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: BELONGS TO THE APP FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Johnstone E.M., Chaney M.O., Norris F.H., Pascual R., Little S.P., "Conservation of the sequence of the Alzheimer's disease amyloid peptide in dog, polar bear and five other mammals by cross-species polymerase chain reaction analysis.";
Brain Res. Mol. Brain Res. 10:299-305(1991).

-1-DOMAIN: THE CLATHRIN-BINDING SITE IS ESSENTIAL FOR ITS ASSOCIATION WITH X11-ALPHA, -BETA, AND -GAMMA, THE SEQUENCE SPECIFIC RECOGNITION EXTENDS TO PEPTIDE RESIDUES THAT ARE C-TERMINAL TO THE NPXX MOTIF. THIS INTERACTION APPEARS TO BE INDEPENDENT OF PHOSPHORITATION (BY SIMILARITY).
-1-SIMILARITY: BELONGS TO THE APP FAMILY.
-1-SIMILARITY: CONTAINS 1 BPTI/KUNITZ INHIBITOR DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Saimiri sciureus (Common squirrel monkey).
